4.4 Statement of the measurement uncertainty

The data and results referenced in this document are true and accurate. The reader is cautioned that there may be errors within the calibration limits of the equipment and facilities. The measurement uncertainty was calculated for all measurements listed in this test report according to CISPR 16-4-2 “Specification for radio disturbance and immunity measuring apparatus and methods – Part 4-2: Uncertainties, statistics and limit modelling – Uncertainty in EMC measurements“ and is documented in the Nemko Spa Technical Procedure WML1002. Furthermore, component and process variability of devices similar to that tested may result in additional deviation. The manufacturer has the sole responsibility of continued compliance of the device. Hereafter the best measurement capability for Nemko Spa laboratory is reported:

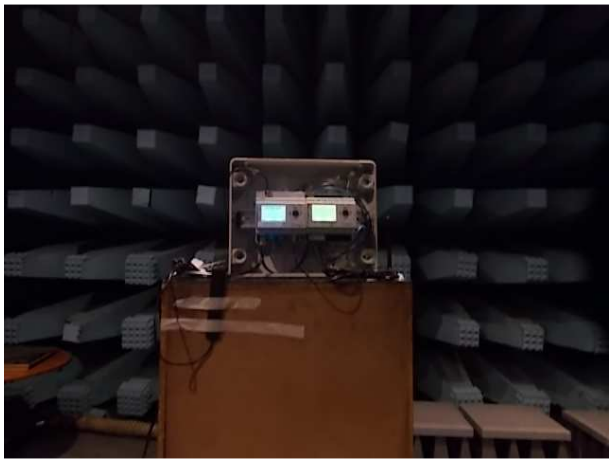
5 TEST CONDITIONS AND RESULTS

5.1 RF output power

5.1.1 Photo documentation of the test set-up



5.1.2 Test method

The RF output power is defined as the mean equivalent isotropically radiated power (e.i.r.p.) of the equipment during a transmission burst. The measurements for RF output power shall be performed at both normal environmental conditions and at the extremes of the operating temperature range.

In the case of equipment intended for use with an integral antenna and where no external (temporary) antenna connectors are provided, a test fixture may be used to perform relative measurements at the extremes of the operating temperature range.

When performing radiated measurements, the UUT shall be configured and antenna(s) positioned (including smart antenna systems and equipment capable of beamforming) for maximum e.i.r.p. towards the measuring antenna. In case of conducted measurements the transmitter shall be connected to the measuring equipment.

For equipment using wide band modulations other than FHSS, the measurement shall be performed at the lowest, the middle, and the highest channel on which the equipment can operate. These frequencies shall be recorded.

A test site as described in annex B of ETSI EN 300 328 and applicable measurement procedures as described in annex C ETSI EN 300 328 shall be used.

5.1.3 Limits

For adaptive equipment using wide band modulations other than FHSS, the maximum RF output power shall be 20 dBm.

The maximum RF output power for non-adaptive equipment shall be declared by the supplier and shall not exceed 20 dBm. For non-adaptive equipment using wide band modulations other than FHSS, the maximum RF output power shall be equal to or less than the value declared by the supplier.

This limit shall apply for any combination of power level and intended antenna assembly.

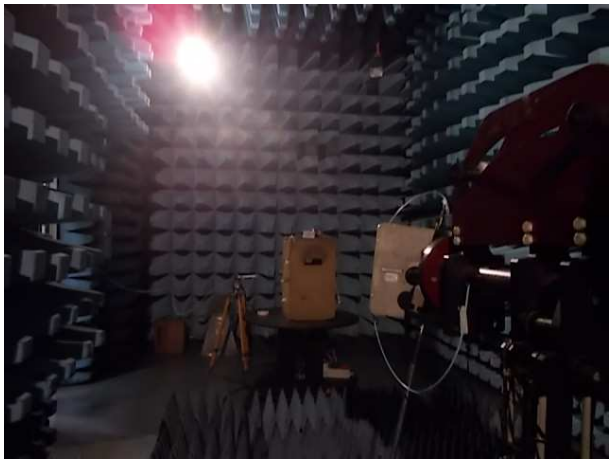
5.2 Transmitter unwanted emissions in the spurious domain

5.21 Photo documentation of the test set-up



5.2.2 Test method

Transmitter unwanted emissions in the spurious domain are emissions outside the allocated band and outside the out-of-band domain as indicated in the figure of clause 5.4.3 when the equipment is in Transmit mode. The level of spurious emissions shall be measured as, their power in a specified load (conducted spurious emissions) and their effective radiated power when radiated by the cabinet or structure of the equipment (cabinet radiation). For equipment using wide band modulations other than FHSS, the measurement shall be performed at the lowest and the highest channel on which the equipment can operate. These frequencies shall be recorded. The equipment shall be configured to operate under its worst case situation with respect to output power. If the equipment can operate with different Occupied Channel Bandwidths, then the equipment shall be configured to operate under its worst case situation with respect to spurious emissions. In case of conducted measurements, the radio equipment shall be connected to the measuring equipment via an attenuator. The test site as described in annex B of ETSI EN 300 328 and applicable measurement procedures as described in annex C of ETSI EN 300 328 shall be used. The spectrum analyser shall be set as show in the clause 5.3.10.2.1 of ETSI EN 300 328. The spectrum in the spurious domain shall be searched for emissions that exceed the limit values given in the following table or that come to within 6 dB below these limits. Each occurrence shall be recorded.

5.2.3 Limits

The transmitter unwanted emissions in the spurious domain shall not exceed the values given in the following table.

Frequency range	Maximum power	Bandwidth
30 MHz to 47 MHz	-36 dBm e.r.p.	100 kHz
47 MHz to 74 MHz	-54 dBm e.r.p.	100 kHz

Frequency (MHz)	Level (dBm)	Limit (dBm)	Margin (dB)
1065.7500	-39.4	-30.1	-9.3
1214.5000	-45.0	-30.1	-14.9
1641.5000	-44.2	-30.1	-14.1
2457.7500	-20.5	-30.0	9.5

Limit exceeded by the carrier

Antenna polarization: Vertical
Operation mode: 1 (Channel HIGH)
Configuration mode: 1
Remarks: Frequency range: 1 GHz to 3 GHz

Verdict: Pass
